# Smappee Switch

The genuinely intelligent smart plug that also measures your energy consumption.

# Quick Install Guide

1

Open the Smappee app. Go to Control, then Smart Devices. Press the plus sign and choose one of the available white goods or 'Other devices'.

2

Scan the barcode on the wire of your Smappee Switch or type its serial number manually.

3

Plug in your Switch within a maximum range of 10 to 20 metres\* of your Smappee energy monitor and connect it to your chosen appliance or group of appliances with your power strip.

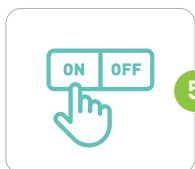

4

Your Smappee energy monitor will automatically start looking for it. Go to Control and select your Switch. Its status will change to Connected. If the status has not changed to Connected after 10 minutes, move the Switch closer to your Smappee energy monitor. A wall or another obstacle\* is probably disturbing the communication.

\* A Smappee Switch can pass on the signal to another Smappee Switch so you can bridge longer distances and overcome obstacles such as concrete or walls. You can link up to 3 Smappee Switches. The maximum range between each of these Smappee Switches is 10 to 20 metres.

**ⓘ The Smappee Switch only works with a Smappee Infinity setup including a Genius as gateway and with Smappee legacy monitors (Smappee Energy, Solar, Plus and Pro). Not compatible with the Connect series.**

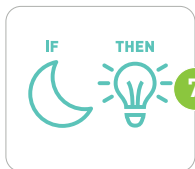

5

Now you can test your Smappee Switch. Operate the connected appliance by switching it on or off via the app.

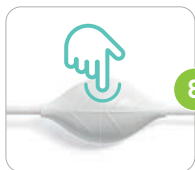

6

Via the Switch detail screen in the Smappee App you can operate and view the energy consumption of the appliance(s) connected to your Switch. This is also the place where you can activate the manual operating function, allowing you to tap the Switch to power it on or off.

7

Let's make it even smarter. Add Smappee automations and control your appliance even more energy efficiently.

8

Just tap\* the Smappee Switch once.

\*The manual tap operating function needs to be activated via the App.
